## Class- IX Chemistry Session 2020-21

### LANGUAGE OF CHEMISTRY

#### Valency

Valency is the combining capacity of an element. The number of electrons donated or accepted by an atom of an element so as to have electronic configuration of nearest noble gas is called its valency.

#### Variable Valency

Certain elements have more than one valency. They exhibit variable valency. For example, copper, tin, iron and mercury exhibit variable valency. Copper combines with oxygen to form cuprous oxide ( $\text{Cu}_2\text{O}$ ) and cupric oxide ( $\text{CuO}$ ).

Valency of oxygen being two, combining capacity of copper in the first case is one and that in the second case is two. The suffix “ous” is used to indicate the lower valency and the suffix “ic” to indicate the higher valency. The following table gives the names of some compounds with variable valencies of elements.

Compound	Valency	Ion
Cuprous ( $\text{Cu}_2\text{O}$ )	1	$\text{Cu}^+$
Cupric oxide ( $\text{CuO}$ )	2	$\text{Cu}^{2+}$
Ferrous oxide ( $\text{FeO}$ )	2	$\text{Fe}^{2+}$
Ferric oxide ( $\text{Fe}_2\text{O}_3$ )	3	$\text{Fe}^{3+}$

## LIST OF COMMON ACIDIC AND BASIC RADICALS.

### Basic Radicals

Monovalent electropositive	
Ammonium	$\text{NH}_4^+$
Aurous [Gold (I)]	$\text{Au}^+$
Argentous [Silver (I)]	$\text{Ag}^+$
Cuprous [Copper(I)]	$\text{Cu}^+$
Hydrogen	$\text{H}^+$
Lithium	$\text{Li}^+$
Sodium	$\text{Na}^+$
Potassium	$\text{K}^+$
Mercurous [Mercury (I)]	$\text{Hg}^+$

Divalent electropositive	
Argentica	$\text{Ag}^{2+}$
Barium	$\text{Ba}^{2+}$
Calcium	$\text{Ca}^{2+}$
Cupric [Copper (II)]	$\text{Cu}^{2+}$
Ferrous [Iron (II)]	$\text{Fe}^{2+}$
Magnesium	$\text{Mg}^{2+}$
Manganese	$\text{Mn}^{2+}$
Mercuric [Mercury (II)]	$\text{Hg}^{2+}$
Nickel	$\text{Ni}^{2+}$
Plumbous [Lead (II)]	$\text{Pb}^{2+}$
Platinous [Platinum (II)]	$\text{Pt}^{2+}$
Stannous [Tin (II)]	$\text{Sn}^{2+}$
Zinc	$\text{Zn}^{2+}$

Trivalent electropositive	
Aluminium	$\text{Al}^{3+}$
Arsenic	$\text{As}^{3+}$
Auric [Gold (III)]	$\text{Au}^{3+}$
Bismuth	$\text{Bi}^{3+}$
Chromium	$\text{Cr}^{3+}$
Ferric [Iron (III)]	$\text{Fe}^{3+}$

Tetravalent electropositive	
Plumbic [Lead (IV)]	$\text{Pb}^{4+}$
Platinic [Platinum (IV)]	$\text{Pt}^{4+}$
Stannic [Tin (IV)]	$\text{Sn}^{4+}$

## ACIDIC RADICAL LIST

Ion	Formula
Nitrate	$\text{NO}_3^-$
Nitrite	$\text{NO}_2^-$
Phosphate	$\text{PO}_4^{3-}$
Hydrogen Phosphate	$\text{HPO}_4^{2-}$
Dihydrogen Phosphate	$\text{H}_2\text{PO}_4^-$
Sulfate	$\text{SO}_4^{2-}$
Carbonate	$\text{CO}_3^{2-}$
Hydrogen Carbonate	$\text{HCO}_3^-$
Hydroxide	$\text{OH}^-$

Ion	Formula
Ammonium	$\text{NH}_4^+$
Acetate	$\text{C}_2\text{H}_3\text{O}_2^-$
Hypochlorite	$\text{ClO}^-$
Chlorite	$\text{ClO}_2^-$
Chlorate	$\text{ClO}_3^-$
Perchlorate	$\text{ClO}_4^-$
Permanganate	$\text{MnO}_4^-$
Chromate	$\text{CrO}_4^{2-}$
Dichromate	$\text{Cr}_2\text{O}_7^{2-}$

## COMPOUND AND ITS CHARACTERISTICS

A **compound** is a substance made up of a definite proportion of two or more elements. A **chemical formula** tells us the number of atoms of each element in a compound. It contains the symbols of the atoms of the elements present in the compound as well as how many there are for each element in the form of subscripts.

### Characteristics of Compounds

All compounds share some common properties which enable us to identify them.

- Compounds are formed by chemical reactions, which usually involve an exchange of energy (**heat/light**) with the surroundings.
- A compound has properties that are different from the properties of its constituent elements

How is sodium chloride different from sodium or chlorine?

## COMMON AND CHEMICAL NAMES OF SOME COMPOUNDS

Common Name	Chemical Name	Chemical Formulae
Dry Ice	Solid Carbondioxide	$\text{CO}_2$
Slaked Lime	Calcium Hydroxide	$\text{Ca}(\text{OH})_2$
Bleaching Powder	Calcium Oxychloride	$\text{CaOCl}_2$
Nausadar	Ammonium Chloride	$\text{NH}_4\text{Cl}$
Caustic Soda	Sodium Hydroxide	$\text{NaOH}$
Rock Salt	Sodium Chloride	$\text{NaCl}$
Caustic Potash	Potassium Hydroxide	$\text{KOH}$
Potash Alum	Potassium Aluminium Sulphate	$\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$
Epsom	Magnesium Sulphate	$\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$
Quick Lime	Calcium Oxide	$\text{CaO}$
Plaster of Paris	Calcium Sulphate	$(\text{CaSO}_4)^{1/2} \cdot \text{H}_2\text{O}$
Gypsum	Calcium Sulphate	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
Green Vitriol	Ferrous Sulphate	$\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$
Mohr's Salt	Ammonium Ferrous Sulphate	$\text{FeSO}_4 (\text{NH}_4)_2 \text{SO}_4 \cdot 6\text{H}_2\text{O}$
Blue Vitriol	Copper Sulphate	$\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$
White Vitriol	Zinc Sulphate	$\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$
Marsh Gas	Methane	$\text{CH}_4$
Vinegar	Acetic Acid	$\text{CH}_3\text{COOH}$
Potash Ash	Potassium Carbonate	$\text{K}_2\text{CO}_3$
Hypo	Sodium Thiosulphate	$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$
Baking Powder	Sodium Bicarbonate	$\text{NaHCO}_3$
Washing Soda	Sodium Carbonate	$\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$
Magnesia	Magnesium Oxide	$\text{MgO}$
Chalk (Marble)	Calcium Carbonate	$\text{CaCO}_3$

## WRITING CHEMICAL FORMULA

### Iron(III)hydroxide

write  
symbol

Remember  
charge

Cross the  
charge

## **BALANCING CHEMICAL EQUATION**

Balance the following equation:

**Identify the reactants and products** This has been done in the question.

**Write the equation for the reaction** This has been done in the question.

**Count the number of atoms of each element in the reactants and products**

Reactants: Mg=1 atom H=1 atom, Cl=1 atom

Products: Mg=1 atom, H=2 atoms, Cl=2 atoms

**Balance the equation** The equation is not balanced since there are two chlorine atoms in the product and only one in the reactants. If we add a coefficient of two to the HCl to increase the number of H and Cl atoms in the reactants, the equation will look like this:

**Check that the atoms are balanced**

If we count the atoms on each side of the equation, we find the following:

Reactants: Mg=1 atom, H=2 atoms, Cl=2 atoms

Products: Mg=1 atom, H=2 atoms, Cl=2 atoms

The equation is balanced. The final equation is:

# DETERMINATION OF MOLECULAR MASS AND PERCENTAGE COMPOSITION

## Relative Molecular Mass

The Relative Molecular Mass ( $M_r$ ) is the sum of the Relative Atomic Mass ( $A_r$ ) of each atom in the molecule.

### How to find the relative molecular mass?

1. Determine the molecular formula of the molecule.
2. Determine the number of atoms of each element in the molecule.
3. Use the periodic table to determine the atomic mass of each element.
4. Multiply the number of atoms of each element with the atomic mass.
5. Add the values to get the relative molecular mass.

#### Example:

Find the  $M_r$  of ammonia

Molecular formula of ammonia is  $\text{NH}_3$

$$\text{N} = 1 \times 14 = 14$$

$$\text{H} = 3 \times 1 = 3$$

$$M_r \text{ of ammonia} = 14 + 3 = 17$$

$$\begin{array}{l} A_r \text{ of N} = 14 \\ A_r \text{ of H} = 1 \end{array}$$

#### Example:

Find the  $M_r$  of ammonium sulfate

Molecular formula is  $(\text{NH}_4)_2\text{SO}_4$

$$\text{N} = 2 \times 14 = 28$$

$$\text{H} = 4 \times 2 \times 1 = 8$$

$$\text{S} = 1 \times 32 = 32$$

$$\text{O} = 4 \times 16 = 64$$

$$M_r \text{ of } (\text{NH}_4)_2\text{SO}_4 = 28 + 8 + 32 + 64 = 132$$

$$\begin{array}{l} A_r \text{ of N} = 14 \\ A_r \text{ of H} = 1 \\ A_r \text{ of S} = 32 \\ A_r \text{ of O} = 16 \end{array}$$

## Calculating Percentage Composition

Calculate the percentage composition of magnesium carbonate,  $\text{MgCO}_3$ .

Formula mass of magnesium carbonate:

$$24.31 \text{ g} + 12.01 \text{ g} + 3(16.00 \text{ g}) = 84.32 \text{ g}$$

$$\text{Mg} = \left( \frac{24.31}{84.32} \right) \cdot 100 = 28.83\%$$

$$\text{C} = \left( \frac{12.01}{84.32} \right) \cdot 100 = 14.24\%$$

$$\text{O} = \left( \frac{48.00}{84.32} \right) \cdot 100 = 56.93\%$$

**100.00**
