**India – The Land Surface**

The type of land surface of India differs from place to place. The high mountains in the north are called Himalayas. The large plains in the northern India are called the northern fertile plains. The southern part of India is a plateau. India is the seventh largest country in the world. The plains in India are very fertile because of the many rivers that flow through them. A peninsula is a piece of land surrounded by water on three sides. Most part of the Thar desert lies in the state of Rajasthan. As we know the land surface of India differs from place to place so does the climate of India.
